Code	Description	Description	Examples	Description	Examples
Platform switch	The participant switches to a new platform to search, browse or interact with AI on that platform. If a participants clicks on a result in, for instance, Google and inspects this page, this is **not** counted as a platform switch unless they start searching on that platform afterwards. The **Platform switch** should then be placed after **View single result**.	This column contains the platform they switch to.	• Google • Google Image Search • ChatGPT • Claude • Meta.AI • Steam • Reddit • Steam • Steam "More like this"	Any additional notes that are relevant for this platform switch (e.g., did they verbalize a reason?)	N/A
Query	The participant enters a query into a search engine or prompts an AI.	The specific query/prompt that was entered into the search engine or AI. Queries can be combined with filters (see the last example). Queries should be annotated as DE, EN or MU. If the participant is clearly formulating a German query, but includes English terms that don't have a German equivalent, it should still be marked as German. If the participant searches for a game title, it should be marked as NE (named entity). Queries that are entered into the search bar but never submitted to the search engine or empty queries should not be included!	• "sandbox indie game towns building" • "game retro fighter optic" • category="Shoot-em-up" | sort-by="most popular" • "Townscaper"	Any relevant information about the query (or what prompted it).	• Adding terms from query suggestions (e.g., "low end pc") • Misspelling • Misspelling corrected by Google • Answer to a question by the AI chatbot • Query strategy change
Browsing	The participant browses a list of tags or categories to filter the space of available games.	If the participant clicks on a tag or category, the name of the tag/category should be added as an action detail. If the participant did not find a category or tag to select, this field is left empty.	• "Run-and-gun" • "City builder" • "Cozy games"	N/A	N/A
View result list	The participant is viewing the results list generated by a search engine for a specific **Query** (which should precede the **View result list** event).	Describes how the participant interacts with the result list. No scrolling means they only look at the results above the fold (i.e., the results that are immediately visible without scrolling. Briefly scrolling means they quickly scroll through a handful of (rows of) results. Extensive scrolling means they scroll through many (rows of) results. If the participant clicks on "Show more results", this also counts as extensive scrolling, but opening the next results pages should not be included as an additional **View results list** event. If someone returns the same result list after inspecting a result and immediately clicks on another result, this does not have to be annotated with another **View result list** event. However, if the participant scrolls briefly or extensively, then it should be marked as another **View result list** event.	• No scrolling • Brief scrolling • Extensive scrolling	N/A	N/A
View AI response	The participant spends time reading (part of) the AI response or the AI summary produced by a search engine.	Describes how extensively they interact with the AI response/summary. 'Read' means they read (part of) the response in detail, while 'skim' means they briefly go over the response.	• Skim • Read	Any relevant information about the interaction with the AI response.	• AI answer has instructions on how to search for video games • Follow link to reddit
View single page	The participant clicks on a result and opens a web page to inspect it.	This column describes multiple aspects of the participant's interaction with the result page. Aspects are separated by a pipe symbol ("|"). Aspects include website (e.g., "YouTube", "Steam", "MobyGames"), type of content (e.g,. "top-N list", "review"), effort spent (e.g., "no scrolling", "brief scrolling", "extensive scrolling").	• SteamDB | Top-N list | Extensive scrolling • YouTube | Review | Brief scrolling • IGN | Preview | No scrolling	Any additional noteworthy behavior about the interaction with the result page.	If someone immediately hits the back button or starts searching again, it could be noted as "Bounced immediately". If someone verifies that Townscaper is the game ("Verification").
View info box	The participant clicks on a result and views the sidebar infobox without leaving the platform (i.e., the search engine or the AI).	Describes how the participant interacts with the info box.	• Views multiple screenshots	Any additional noteworthy behavior about the interaction with the info box.	• Answer #1 • Results #3
Experiment ended	The experiment is ended, either because the participant found the result, because they gave up, or because the experimenter ended the search process because the participant ran out of time.	This column should list whether the result was found or not	• Result found • Result not found	This column should list whether the experimenter ended the result or whether the participant gave up. It could contain additional notes about why the participant gave (e.g., fatigue, no more ChatGPT tokens left, etc.)	• Participant gave up (fatigued) • Ended by experimenter
